Session background

According to research from MarketsandMarkets, the aircraft cabin interiors market is projected to reach US\$ 29.16 billion by 2021, at a compound annual growth rate of 11.57% from 2016 to 2021.

The report, *“Aircraft Cabin Interiors Market - Global Forecast to 2021”*, expects the seating segment to dominate the aircraft cabin interiors market over the next five years.

As MarketsandMarkets cite, the demand for aircraft seating is primarily driven by upgradation of aircraft programs to reduce operational cost, increasing aircraft deliveries, and significant growth in air traffic across the globe.

Discussion points

- As technology advances and new materials emerge is repair rather than replace becoming more commonplace?
- How are seating manufacturers responding to the demand for IFEC and future proofing (incorporating in-seat power, USBs, tablet storage and so on)
- How do airlines select cabin products for cabin refreshments – is it based on economics, image, operational efficiencies or other factors?
